Patent No. 598126
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Hansson, Lennart
TITLE OF INVENTION: Encombinant Stratum Corneum Chymotryptic
TITLE OF INVENTION: Enzyme (SCCE)
NUMBER OF SEQUENCES: 17
CORRESPONDENCE ADDRESS: 17
ADDRESSEE: White & Case, Patent Department
STREET: 1155 Avenue of the Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match 100.0%; Score 49; DB 2; Length 225; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 13
US-09-644-600-4

Sequence 4, Application US/09644600

Sequence Mo. 6451500

GENERAL INFORMATION:

APPLICANT: O'Brien, Timothy J.

APPLICANT: O'Brien, Hirotoshi

TITLE OF INVENTION: TADG-15: An Extracellular Serine Protease

TITLE OF INVENTION: O'PERPRESSE IN CARCINOMAS

FILE REFERENCE: D6064(1P/D)

CURRENT FILING DATE: 1090-08-23

FRIOR APPLICATION NUMBER: 09/421,213

FRIOR APPLICATION NUMBER: 09/421,213

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, constrained and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOVI). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dipippo VA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide (11) method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method of corpreptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide; now a sequences have antidiabetic, anotectic, antibacterial, viruide, immunomodulator, cytostatic, nootropic, antibacterial, viruide, immunomodulator, cytostatic, nootropic, antibacterial, viruide, immunomedulator, cytostatic, nootropic, antibacterial, viruide, or syndrome associated with a human disease. The polypeptide or the nucleic cidisorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders und antilupaemia and to diagnose, treat or prevent metabolic cidisease, immune disorders such as Alzhaimer's disorders and various or probes, in chromosome mapping, tissue typing, preventive medicine and corporation, invancion invancion. The present sequence represents a human NoVX from the recent invancion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food pupplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this are the contractions of the product 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      patent did not appear in the printed specification, but was obtained electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

# Claim 1; Page 171; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 cd e.g. NOV1). Also described in a composition comprising a polypeptide described above and a carrier; (2) a kit composition or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a desake associated with altered levels of expression of the above collaborated with altered levels of expression of the above collaborated with altered levels of expression of the above; (10) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for a berrant physiological interactions of the polypeptide; (11) a method of special interactions of the polypeptide; (11) a method of a pathology associated with the polypeptide; (12) a method for modulator of a pathology associated with the above polypeptide; (12) a method for producing the above polypeptide or the activity of the method for producing the above polypeptide or mammal; and (14) a method for producing the above polypeptide or special interaction associated with a memoral activities, and can be used in gene therapy. The collaboration associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic syndrome associated with a human disease. The polypeptide or pathology associated with a human disease and various diabeters such as diabetes or obesity, infections, cancering cardiaced with a human disease. The polypeptide or persent invention in the pre present invention.

The present invention describes NOVX proceins, where X can be 1 to 55 (e.g. NOVI). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising; in one or more containers, the composition described above; (3) an isolated nucleic acid described above; (3) an isolated nucleic acid molecule described above; (5) a cell nucleic acid molecule described above; (5) a cell of comprising the nucleic acid molecule described above; (5) a cell of presence or amount of the above polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above of polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of apthology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of a pathology associated with the polypeptide; (12) a method for modulator or activity of the polypeptide described above polypeptide; or preventing a pathology associated with the above polypeptide; or preventing a pathology associated with the above polypeptide or sorgeness and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating an adminishment of morecitic, antipacting and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating and oplypeptide is useful in manufacturing a medicament for treating and contained may be used to disquese. The polypeptide or particles and antilipaemias. The nucleic acid can be used as hybridisation associated with a human of a so

obesity, or New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing pharmacogenomics.

Claim 1; Page 172; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6 an antibody that immunospecifically brinds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the sample; (8) methods for determining the presence of corporation to a disease associated with altered levels of expression of the above

                                                                                                                                                                                                                                                                                                                 88888888888
                                                                                                                                                                                                     8
polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an abstrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a medulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (11) a method of medulator or preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide. Novx or preventing a pathology associated with the above polypeptide. Novx or preventing a method for producing the above polypeptide. Novx or preventing a unitable of an ordectic, antibacterial, viruide.

CC sequences have antidiabetic, nootropic, natioparterial, viruide,

and antilipaemic activities, and can be used in gene therapy. The colypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic correspondences under such as diabetes or obesity, infections, cachexia, cancer, concredegenerative disorders such as Alzheimer's disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation or probes, in chromosome mapping, tissue typing, preventive medicine and process the present sequence represents a human NOVX from the
                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500). 15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15 protease activity on eachil for vaccinating an individual against TADG-15, having, suspected of having or at risk of epting cancer. Furtherance, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   human, NOVX, antidiabetic anorectic, antibacterial, virucide, immunomodulator; cytostatic, nootropic, neuroprotective; antipakanica antilpakanic, gene therapy, human disease; metabolic disorder, diabetes; obesity, infection; cachexia, cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease;

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 172; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) at it composition, in one or more containers, the composition described above; (3) an isolated nucleic acid described above; (3) an isolated nucleic acid containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the above vector; (6) an antibody that immunospecifically breamed or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for abore; identifying an agent that binds to the polypeptide (11) a method of screening for a modulator of acitivity or of latency or predisposition to a pathology associated with the above polypeptide; (12) a method for modulating or preventing a pathology associated with the above polypeptide. Novy a pathology associated with the above polypeptide in a method for protection; neuroprotective, antipaxkinsonian and antilipsemic acities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to diagnose; treat or prevent metabolic probe, in the nucleic ac

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics

Claim 1; Page 169-170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid

```
comprising the nucleic acid molecule described above; (s) a cell comprising the nucleic acid molecule described above; (s) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above comprised of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of corrections of the polypeptide or an aberrant expression or a pathology associated with the polypeptide; (12) a method of corrections of the polypeptide; (13) methods of treating or preventing a pathology associated with the above polypeptide in a method for producing the above polypeptide or the nucleic and antilipaemic activities, and can be used in gene therapy. The correction and antilipaemic activities, and can be used in gene therapy. The correction sociated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic corrections, cancer, immune disorders, and can be used in gene therapy. The correction may be used to diagnose, treat or prevent metabolic correction and antilipaemic aciders, undersective, antiparting and variation and disorders such as diabetes or obesity, infections, cachevia, cancer, contents, and can be used to diagnose, treat or prevent metabolic acide cachevial and variation and cachevial and produce acide cachevial as diabetes or obesity, infections, cachevial and cachevial and produce aci
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present invention.

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 170; 586pp; English.

The present invention described: (1) a composition comprising a polypeptide (e.g. NOVI). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated muclaic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the encodes a NOVX protein of the invention; (4) a vector comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nuclaic acid molecule of a disease associated with altered levels of expression of the above comprising the presence of or predisposition to sample; (8) methods for determining the presence of or predisposition to comprise the complex of the above polypeptide of the above colypeptide of a disease associated with altered levels of expression of the above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic or compression or aberrant physiclogical interations of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to the activity of the polypeptide described above; (13) methods of treating or pathology associated with the above polypeptide in a method for producing the above polypeptide in a useful in mannandiabentic, and can be used to diagnose, treat or prevent metabolic concroduce associated with a human disease. The polypeptide is usef

Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic and testing of cpds. useful for treating or develop products for the design associated with beta-amyloid peptide, esp. Alzheimer's disease

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence coding at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve commetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an accentual scales essenced for screening or inflammation, pruritus, atopic dermatitis, eczema, acne and inherited skin diseases with epidermal hyperkeratosis. The mammal of the invention salso useful so a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the N-terminal synonymous with human stratum corneum chymotryptic enzyme, SCCE synonymous with human stratum corneum chymotryptic enzyme, SCCE synonymous with human stratum conneum chymotryptic enzyme, gcc tragment of the human stratum conneum chymotryptic enzyme, score the formulation in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                           Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SCCE; human; stratum corneum chymotryptic enzyme; kallikrein 7; serine protease; transgenic mammal; skin; skin diseases; skin cancer; hyperkeratosis; acanthosis; epidermal inflammation; dermal inflammation; prutitus; atopic dermatitis; eczema; acne; itch; KLK7; enzyme.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence conjusting at least least significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a commedicate a pathogenic condition, for development or testing of a diagnostic method. It can also be used as a model for a skin disease or skin of an or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an inflammatory skin diseases selected from diseases consisting of epidermal hyperkeratosis, epidermal inflammation, dermal inflammation, dermal hyperkeratosis. The mammal of the invention is also useful as a model for further studies of itch merchanisms and the testing of since and service or an ended for further studies of itch merchanisms and the testing of since and service.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the human stratum corneum chymotryptic enzyme, SCCE which is a serine protease synonymous with human kallikrein 7 (KLK7) and is used in the development of the transgenic mammals described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                        Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Conserved hypothetical protein - Deinococcus radiodurans (strain R1)
C;Species: Deinococcus radiodurans
C;Species: Deinococcus radiodurans
C;Accession: H7541
R;White, O.; Eisen, J.A.; Heidelberg, J.F.; Hickey, E.K.; Peterson, J.D.; Dodson, R.J.;

ring finger protein FXY - human
CjSpecies: Home sapiens (man)
CjSpecies: Home sapiens (man)
CjSpecies: Home sapiens (man)
CjSpecies: Home sapiens (man)
CjAccession: T09482
RjPerry, J.; Feather, S.; Smith, A.; Palmer, S.; Ashworth, A.
Riperry, J.; Feather, Data Library, November 1997
A; Pescription: The human FXY maps to chromosome Kp22.3: Implications for evolution of th A; Reference number: 216687
A; Reference number: L6687
A; Reference number: L6687
A; Residual profit number: RNA
A; Residual profit number: RNA
A; Residual conservation number: RNBL: AFROSSSO, NID: G2827993; PID: G2827994
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          replication protein repA 32K chain - human c/species: Home sapiens (man) c/species: Home sapiens (man) c/species: Home sapiens (man) c/species: 03-Mar-1993 #sequence_revision 03-Mar-1993 #text_change 16-Feb-2001 c/Accession: A43711 ks!pt/d/m.S.; Kelly, T.J. "Primary substrate specificity of recombinant human stratum corneum
"Primary substrate scommun.",

Biochem. Biochys. Res. Commun. 211:586-589(1995).

FINCTION: May catalyze the degradation of intercellular cohesive

FUNCTION: The confided layer of the skin in the continuous

structures in the comified layer of the skin in the continuous

shedding of cells from the skin surface. Specific for anino acid

residues with aromatic side chains in the Pl position. SCCE

cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-
|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation
of precursors to inflammatory cytokines.
-!- TISSUE SPECIFICITY: Abundantly expressed in the skin and is
expressed by kerathocytes in the epidermis. Very low levels are
also seen in the brain and kidney.
-!- SIMILARITY: Belongs to peptidase family SI. Kallikrein subfamily.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -1- SUBUNIT: Heterodimer of a small subunit and a large subunit. Both participate in formation of the active center, but the APP-binding site is exclusively located on the small subunit (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EMBL, AJ248283; CAB49107.1; -.

EMBL; similarity).

-!-DOMAIN: Associates with microtubules in a manner that is dependent on the C-terminal B30.2 domain.
-!-PIM: Phosphorylated on serine and threonine residues.
-!-SIMILARITY: Belongs to the TRIM/RBCC family.
-!-SIMILARITY: Contains 1 B30.2-like domain.
-!-SIMILARITY: Contains 1 B00.2-type zinc fingers.
-!-SIMILARITY: Contains 1 fibronectin type III domain.
-!-SIMILARITY: Contains 1 fibronectin type III domain. "Isoid=Q9UJV3-1; Sequence=Displayed;
Name=1
Isoid=Q9UJV3-2; Sequence=VSP 009009;
-!- TISSUE SPECIFICITY: Low level in fetal kidney and lung, and in adult prostate, overy and small intestine.
-!- DOWAIN: The tripartite motif (RBCC; RING and B box-type zinc fingers and coiled coil domains) mediates dimerization (By Event=Alternative splicing; Named isoforms=2; TISSUE=Kidney,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## ALIGNMENTS

```
The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCB). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide
                                                                                                                     Human stratum corneum chymotrypsin enzyme peptide #2 (residues 123-131).
                                                                                                                                                  Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.

The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB99500). TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protein or its fragments of 9-20 an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15
                                                                                                                                                                                           Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                human; NOVX; antidiabetic; anorectic; antibacterial; virucide; immunomodulator; cytostatic; nootropic; neuroprotective; antiparkinsonian; antilipaemic; gene therapy; human disease; metabolic disorder; diabetes; obesity; infection; cachexia; cancer; neurodegenerative disorder; Alzhehmer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia.

Gaps

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

# Claim 1; Page 172; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a ktt composition or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a call composition to the polypeptide or moust of the above polypeptide or nucleic acid molecule in a composition of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a disease associated with altered levels of expression of the above composition or a disease associated with altered levels of expression of the above composition or method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying an aptential therappetid agent in a custod of identifying an apent that binds to the polypeptide described above; (10) a method for identifying a potential therappetide agent the above of a porthology associated with the polypeptide; (11) a method of a modulator of a composition to a pathology associated with the polypeptide; (12) a method for modulator of a composition of a pathology associated with the above polypeptide. NOVX or predistor, crostation and (14) a method for producing the above polypeptide in a manufacturing a medicament for treating a composition of a modulation of an antilipaemic activities, and can be used in gene therapy. The and antilipaemic activities, and can be used in gene therapy. The and antilipaemic activities, and can be used in gene therapy. The and antilipaemic activities, and can be used in gene therapy. The and antilipaemic activities, and can be used in gene therapy. The and antilipaemic activities, and can be used in gene therapy. The and antilipaemic activities, and can be used in gene therapy. The and antilipaemic activities, and can be used in gene therapy. The acid molecule may be used to disasse. The polypeptide

```
The present invention describes NoVX proteins, where X can be 1 to 55 ce g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit composition or more containers, the composition described above; (3) an isolated mucleic acid containers, the composition described above; (5) a cell or comprising the nucleic acid molecule described above; (5) a cell or comprising the nucleic acid molecule described above; (5) a cell or comprising the nucleic acid molecule described above; (5) a cell or presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) and passes associated with altered levels of expression of the above and a leasas associated with altered levels of expression of the above; (10) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for aberrant physiological interactions of the polypeptide; (11) a method of above; (10) a method for interactions of the polypeptide; (11) a method of a pathology associated with the polypeptide; (12) a method for modulator; or revening a pathology associated with the above polypeptide; (11) a method of a pathology associated with the polypeptide; (12) a method for modulator; or revening a pathology associated with the above polypeptide; (11) a method of corrections and antilipaemic activities, and can be used in gene therapy. The correction associated with a numan disease. The polypeptide or the nucleic syndrome associated with a numan disease. The polypeptide or the nucleic syndrome associated with a numan disease. The polypeptide or barkingon; and interactive disorders such as Alzheimer's disease or Parkingon; cheurodegenerative disorders such as Alzheimer's disease or Parkingon; cheurodegenerative disorders such as Alzheimer's disease or Parkingon; or probes, in chromosome mapping, itsue typing, presents and varied control or alsease or besity, infections, calcidence or the probes in chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô

Diagnosing cancer comprises detecting stratum corneum chymotrypsin

Claim 25; Page 114; 127pp; English.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastesis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primars, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic mino acid sequences. ABG00010-ABG30377 represent novel human diagnostic mino acid sequences. ABG00010-ABG30377 represent novel human diagnostic parent did not appear in the printed specification, but was obtained in electronic format directly from MIMPO at [tp.wipo.int/pub/published_pot_sequences]

The enzyme encoded by this sequence is used in pharmaceutical, cosmetic and skin care products, especially to treat and prevent acne, xeroderma, or other hyperkeratotic conditions (e.g. callosities or keratosis pilaris), ichthyoses, psoriasis, eczema, etc. It is produced recombinantly following mammal, insect, plant, or microorganism transformation with plasmid pS507.                                                                                                                                                                                  The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comporising, in one or more containers, the composition described above; (3) an isolated nucleic acid containers, the composition described above; (3) an isolated nucleic acid molecule described above; (5) a cell of a vector comprising the mucleic acid molecule described above; (5) a cell of a vector comprising the mucleic acid molecule described above; (5) a cell of a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a farse associated with altered levels of expression of the above and propertied or nucleic acid molecule in a first mammalian subject; (9) a disease associated with altered levels of expression of the above; (10) a method for identifying a potential therspeutic agent for above; (10) a method for identifying a potential therspeutic agent for above; (10) a method for identifying a potential therspeutic agent for above; (10) a method of identifying a pathology that is related to an aborrant expression or a pathology associated with the polypeptide; (11) a method for modulating or pathology associated with the above; (13) methods of traating or pathology associated with the above polypeptide. Nove corrections and (14) a method for producing the above polypeptide. Nove corrections and antilipaemic activities, and can be used in gene therapy. The sequences have antidiabetic, anorcotic, antipaterial various or polypeptide is useful in manufacturing a medicament for treating a pathology associated with the above polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic corrections and manufacturing a medicament or prevent metabolic corrections and manufacturing a medicament or prevent metabolic corrections and sociated with a human disease. The polypeptide corrections and sociated with a human disease. The polypeptide corrections and c

compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal hyperkeratosis, acanthosis, epidermal inflammation, pruritus, atopic dermatitis, eczema, acne and inherited skin diseases with epidermal hyperkeratosis. The mammal of the invention is also useful so a model for further studies of 1tch mechanism and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the N-terminal stramment of the human stratum corneum chymotryptic enzyme, SCCE synonymous with human kallikrein 7 (KLK7), used in the development of the transgenic mammals described in the invention

Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic (partic. AV-120 host cells. It is used to develop products for the design and testing of cpds. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease

```
This invention describes a novel non-human transgenic mammal or mammalian sembyro having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous sce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve commetic or a phatnogenic condition, for development or testing of a diagnostic method. It can also be used as a model for a skin disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                                                SCCE; human; stratum corneum chymotryptic enzyme; kallikrein 7; setine protease; kransgenic mammal; skin; skin disease; skin cancer; hyperkeratosis; acanthosis; epidermal inflammation; derma inflammation; pruxitus; atopic dermatitis; eczema; acne; itch; KLK7; enzyme.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve co ameliorate a pathogenic condition, for development or testing of a cosmetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a

skin cancer. The invention is also useful for screening or identifying a composution effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a composution effective for the prevention or treatment of inflammated or composition effective for the prevention or treatment of programmatory skin diseases selected from diseases consisting of epidermal hyperkeratosis, epidermal inflammation, dermal inflammation, pruritus, acophic dermatitis, eczema, acne and inherited skin diseases with epidermal hyperkeratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the human stratum enhuman kallikrein 7 (KLK7) and is used in the development of the transgenic mammals described in the invention 888888888888888888

Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

WPI; 2003-058520/05. N-PSDB; ABX10343.

Claim 1; Page 293-294; 416pp; English.

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (I) Is useful for assessing a therapautic or preventive intervention in a subject having a prostate cancer, which involves determining the expression levels in sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels of at least 10 genes are determined. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer.

Nucleic acids encoding novel human proteases, useful for useful for treating diseases and disorders such as cancers, immune-related diseases and disorders, cardiovascular disease (e.g. restenosis) and inflammatory disorders.

Claim 6; Fig 2N; 313pp; English.

The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asthma), cardiovascular diseases (e.g. restenosis and

         disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. theumator) disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. theumator) architis and psoriasis), central or peripheral nervous system disorders, pain, sexual dysfunction, mood disorders, attention disorders, hypotension, hypertension, psychotic disorders, neurological disorders (e.g. Alzehmer's disease, Parkinson's disease) and dyskinsoias. The nucleic acids and polypeptides are also useful for treating viral infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. qlaucoma) and macular degeneration. The prosected cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) is useful as molecular markers, as drug targets, and for detecting, is useful as molecular markers, as drug targets, and for detecting, clistosing, grading, assessing, monitoring, prognosticating, prognosticating, prognosticating, products or treating, determining prediposition to diseases and conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer of . in tissue sections, in biopsy sample, in total NRA, in lymph, in blood etc. (I) is useful for assessing cancer e.g., to determine the type of cancer, its stage of development, the nature of genetic defect, etc. The polypeptide encoded by (I) can be used as target for therapy or drug discovery. (I) can also be used for expressing the polypeptide and thus for sarching specific binding partners of the polypeptide in the definition of specific genes, and groups of genes, expressed in pathways physically relevant to prostate cancer. The identification of specific ations of the polypeptide in these pathways much are useful in discasse pathways and the delineation of targets in these pathways mitch are useful in disanostic, therapeutic, and clinical prograding actions. This is the amino acid sequence of a protein differentially considered and processed or a protein differentially approach and processed as a protein differentially approach and activities.
    which involves contacting a polypeptide differentially-regulated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     regulated in prostate cancer

(ORIG-) ORIGENE TECHNOLOGIES INC.

Jay G; Sun Z, WPI; 2003-058520/05. N-PSDB; ABX10375. Novel genes which are differentially regulated in prostate cancer, usef for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

Claim 1; Page 351; 416pp; English.

The invention describes genes (1) which are differentially regulated in

```
contracte cancer. (1) is useful to magnesia a prostate cancer in the sample number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (1) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves determining the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels of a least 10 genes are determined. (7) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent under conditions effective for the test agent to modulate a biological activity. (1) is useful as molecular markers, as drug targets, and for detecting, in prostate cancer cells with a test agent under conditions at carvity. (1) is useful as molecular markers, as drug targets, and for detecting, in useful as molecular markers, as sessing, monitoring, prognosticating, products are used in the diagnostic test to assay for presence of cancer of products are used in the diagnostic test to assay for presence of cancer of cancer. (1) is useful for assessing cancer e.g., to determine specially relating to prostate cancer. (1) and its expression to a products are used in the diagnostic test to assay for presence of activity of also activity and a polypeptide encoded by (1) can be used as target for therapy or drug discovery. (1) can also be used for expressing the polypeptide and groups of genes, expressed in pathways which are useful in disease pathways and the delineation of targets in these pathways and the delineation of targets in these pathways and the delineation of a prottinially release pathways and the delineation of a prottinially relation and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human stratum corneum chymctryptic enzyme - ovarian cancer clone O1676P.
prostate cancer. (I) Is useful for diagnosing a prostate cancer in a

                                                                                                                       polynucleotides of the invention have cytostatic activity, and may have a use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a biological sample from the patient with a polynucleotide that selectively hybridizes to a sequence at least 80% identical to any of one of 80 nucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The nucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                   New polynucleotide and polypeptide useful for diagnosing and/or treating
                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is human stratum corneum chymotryptic enzyne (HSCEE), a member of the kallikrein multi-gene family. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KKLLI, KKLLIS, KKLLIS, KKLLI, KKLLIS, KKLLIS, KKLLIS, KKLLIS, KKLLIS, KKLLIS, KKLLIS, And KLK-Lis and KLK-Lis have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They an also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins
cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, determining tumour prognosis, early detection of pre-cancerous lesions, and as vaccines. This sequence corresponds to one of the proteins used for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer.
                                                                                                                                                                                                   Gaps

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin ensyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, cardinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gape

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated Protein Modification and Maintenance (PMM) polypeptide. Polypeptides of the invention may be used in the deignosis, treatment and prevention of disorders associated with decreased expression or activity of PMM. These include gastrointestinal disorders (e.g. Crohm's disease), cardiovascular disorders (e.g. autoimmunefinflammatory disorders (e.g. anaemia), proliferative disorders, developmental disorders, epithalial disorders (e.g. scables), neurological disorders (e.g. Alzheimer's disease) are reproductive disorders (e.g. cetoplic pregnancy), and in gene therapy or a reproductive disorders. (e.g. cetoplic pregnancy), and in gene therapy or a vaccine for such diseases. They may also be used in the assessment of the effects of exogenous compound on the expression of nucleic acid and amino enclassed or froctein modification and maintenance molecules. The current sequences represents a human PMMM of the invention, which has been found to have homology with rat prostasin
